

Course: Common Sense Reasoning

# 7. Manual Acquisition of Common Sense Knowledge

Martin Molina

# Common sense knowledge can be acquired manually

---

- Knowledge engineers can build a common sense knowledge base in the following way:
  1. Analyzing manually different sources of knowledge related to common sense (e.g., texts, experts, etc.), and
  2. Writing the content of a knowledge base using an appropriate representation language (e.g., with a logic-based approach)
- Two representative cases are presented:
  - Cyc project
  - Sumo ontology

# The Cyc project started in 1984

---

- The name Cyc is from encyclopedia
- Cyc started by Douglas Lenat
- Developed by the company Cycorp (since 1995)

Douglas Lenat

[Lenat, 1995] [Lenat, Guha, 1990]

# What is the goal of the Cyc project?

---

Codify millions of pieces of knowledge that compose human common sense:

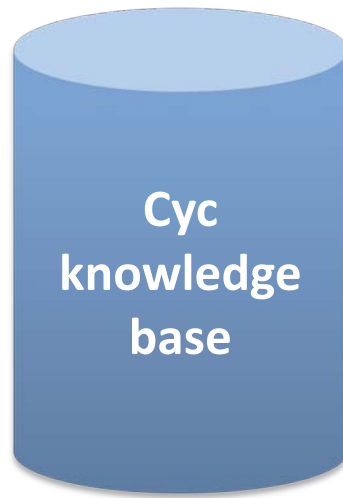

*People fly in planes*

*The water is wet*

...

# The project has generated a large knowledge base

---

7M assertions

0.5M terms

25K types of relations

Note: These numbers change periodically as result of the KB development and maintenance

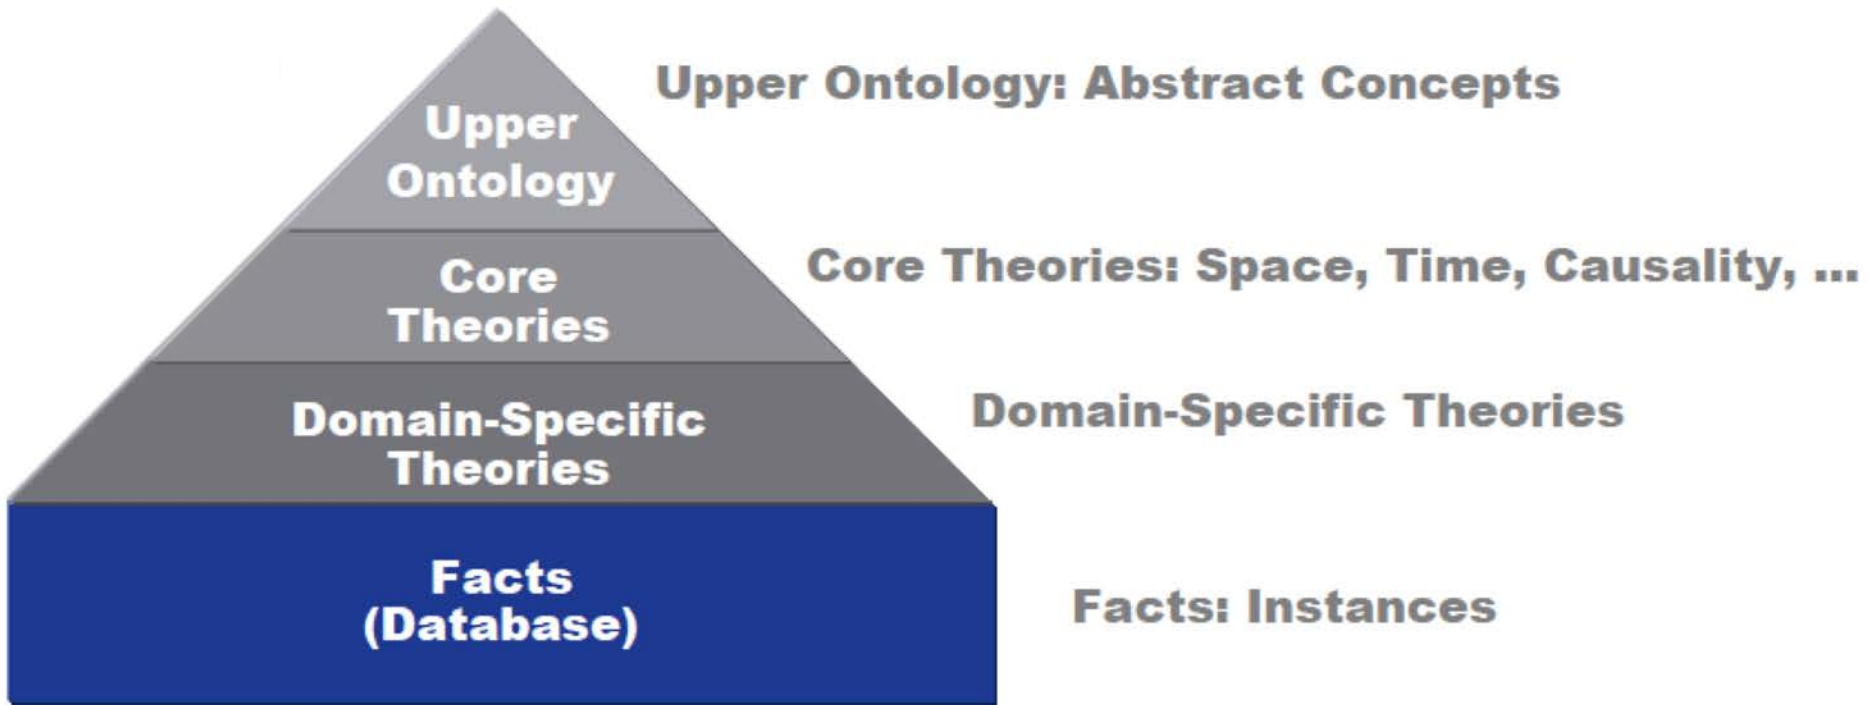

# What are words, terms and assertions?

---

- Words (thousands in usual vocabulary)
  - *Car*
  - *Person*
- Terms (hundreds of thousands)
  - *Fault tolerant computer*
  - *Developing country*
- Assertions (over a million)
  - *An electric guitar is a string musical instrument*
  - *People fly in planes*

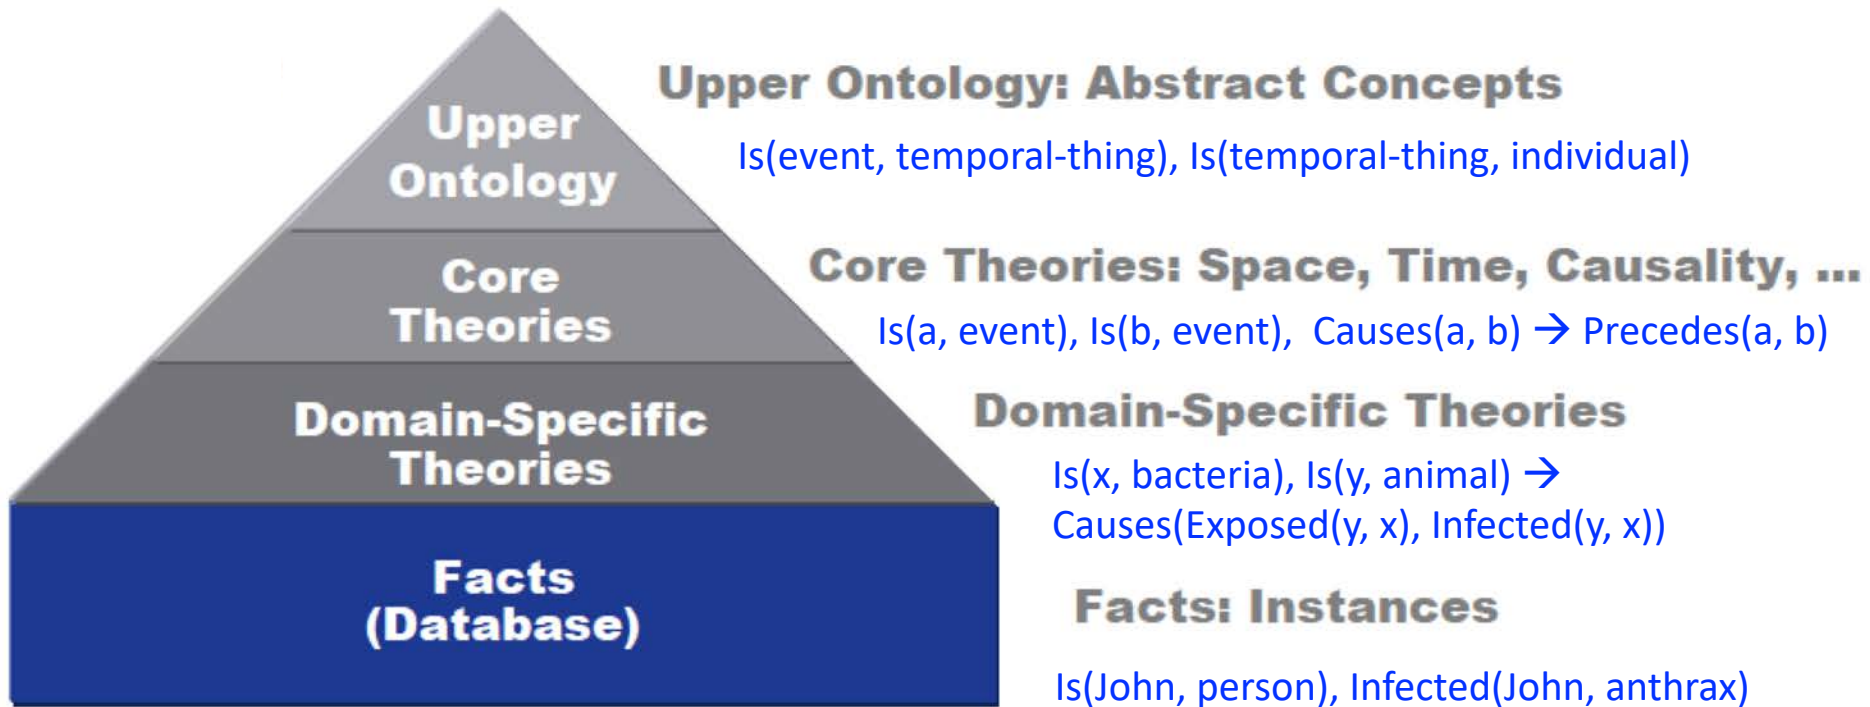

# The knowledge base is structured in layers

---

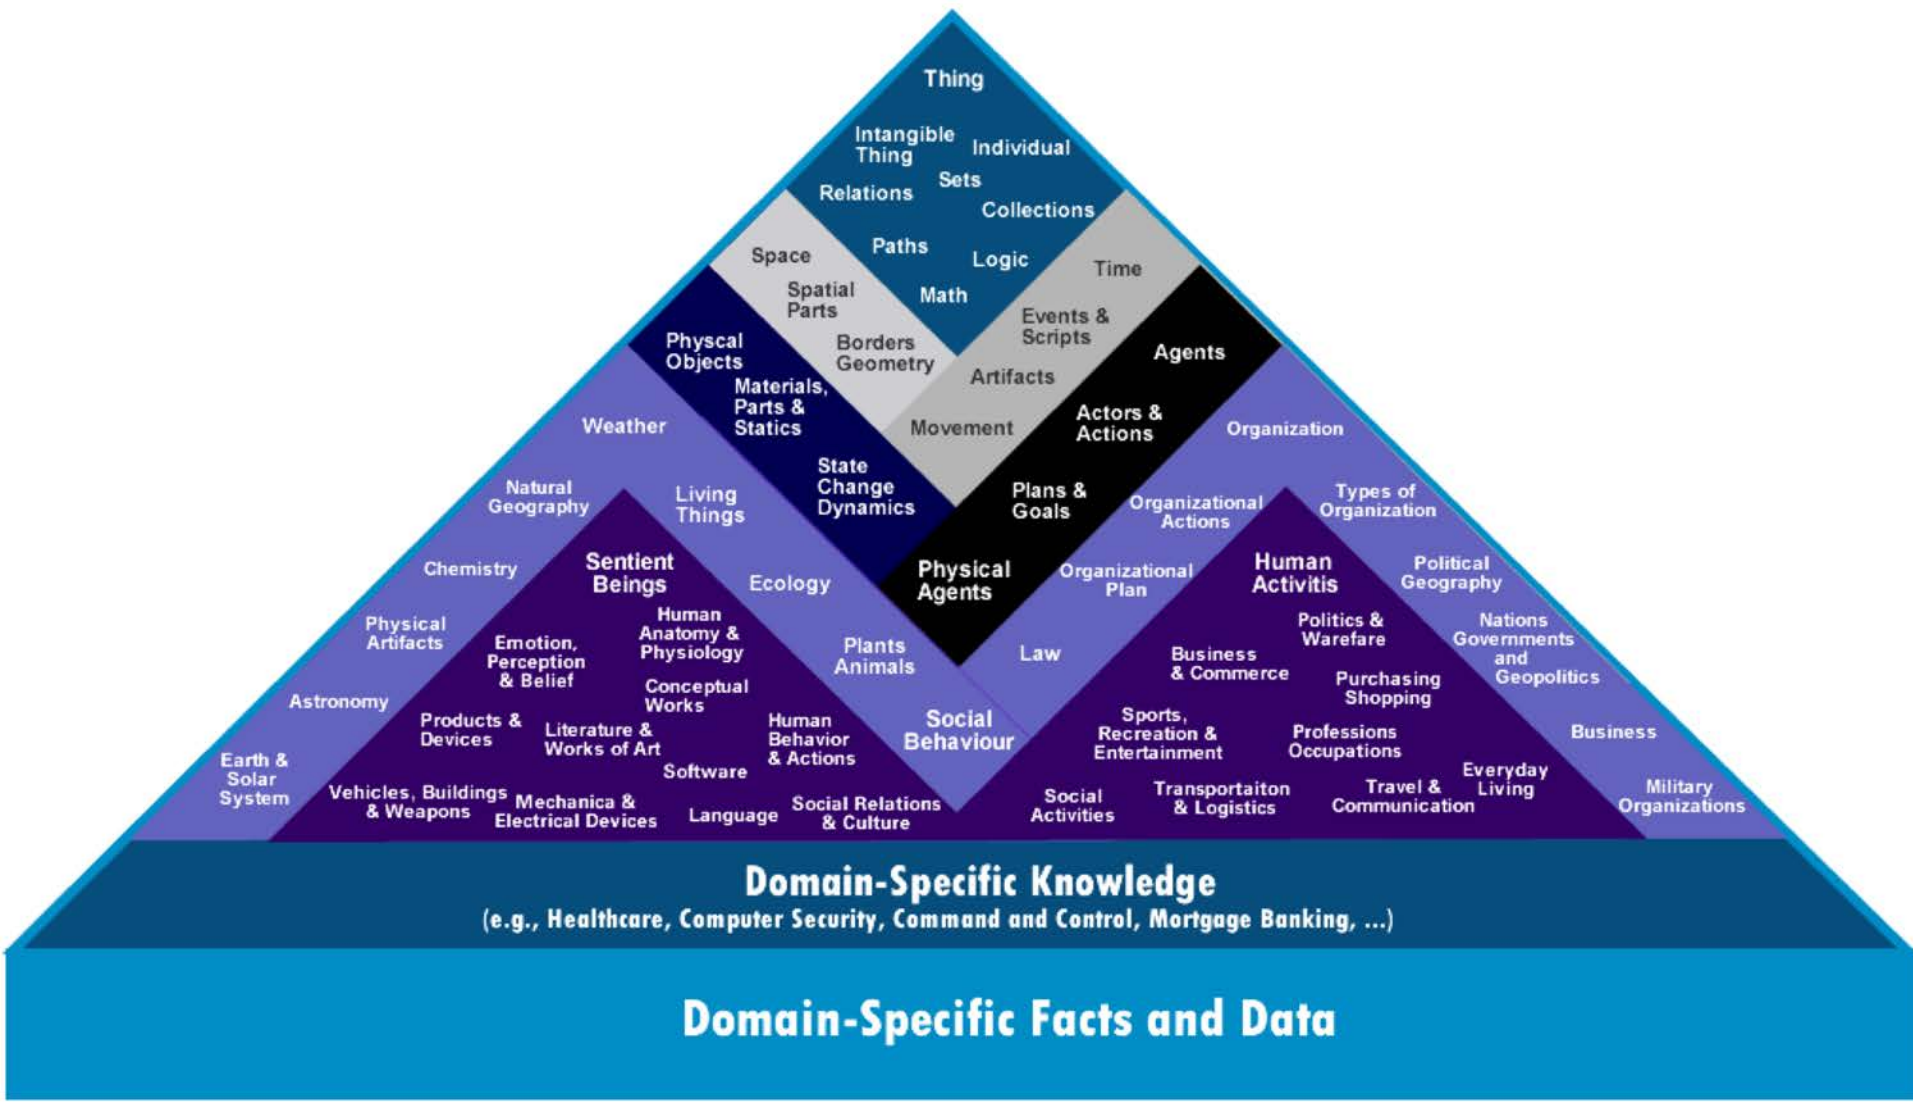

# The knowledge base is structured in layers

---

# How does Cyc represent knowledge?

---

- Cyc uses a logic-based representation
- Cyc uses a representation language called CycL

[Matuszek, et al., 2006]

# Constants are defined in CycL with the prefix # $\$$

---

- Individuals

- # $\$$ BillClinton, # $\$$ Rover, # $\$$ DisneyLand [Objects]
- # $\$$ likesAsFriend, # $\$$ bordersOn, # $\$$ objectHasColor [Relations]
- # $\$$ and, # $\$$ not, # $\$$ implies, # $\$$ forAll [Logical connectives, quantifiers]
- # $\$$ RedColor, # $\$$ Soil-Sandy [Attribute values]

- Collections

- # $\$$ Dog, # $\$$ SnowSkiing, # $\$$ PhysicalAttribute

# Sentences are used to form assertions and queries

---

(#\$isa #John #Person)

(#\$likesAsFriend #John #Peter)

- A TruthFunction:
  - is a relation that can be used to form sentences
  - begins with a lower-case letter
- Types of TruthFunctions:
  - Predicates: #likesAsFriend, #objectHasColor, #isa
  - Logical Connectives: #and, #or, #not, #implies
  - Quantifiers: #forall, #thereExists

# Instances are represented using `#$isa`

---

`($isa X Y)` means:

“X is an instance of collection Y”

Examples:

`($isa #$EiffelTower #$Tower)`

`($isa #$Canada #$Country)`

`($isa #$John #$Person)`

`($isa #$UnitedStatesMarineCorps #$ModernMilitaryOrganization)`

# Collections are represented using #genls

---

(#genls X Y) means:

“Every instance of collection *X* is also an instance of collection *Y*”

Examples:

(#genls #Dog #Mammal)

(#genls #Tower #FixedStructure)

(#genls #ModernMilitaryOrganization #Organization)

Sometimes expressed as:

“*Y* is a genls (generalization) of *X*”

“*X* is a spec (specialization) of *Y*”

# Logical connectives

---

```
(#$and  
  ($performedBy #$GettysburgAddress #$Lincoln)  
  ($objectHasColor #$Rover #$TanColor))
```

```
(#$or  
  ($objectHasColor #$Rover #$TanColor)  
  ($objectHasColor #$Rover #$BlackColor))
```

```
(#$not  
  ($mainColorOfObject #$Rover #$RedColor))
```

```
(#$implies  
  ($mainColorOfObject #$Rover #$TanColor)  
  ($not ($mainColorOfObject #$Rover #$RedColor)))
```

# Quantifiers

---

## Universal Quantifier

```
(#$forall ?THING  
  ($isa ?THING #$Thing))
```

Everything is a thing

## Existential Quantifier:

```
(#$thereExists ?JOE  
  ($isa ?JOE #$Poodle))
```

Something is a poodle

## Others:

```
(#$thereExistsExactly 12 ?ZOS  
  ($isa ?ZOS #$ZodiacSign))
```

There are exactly 12 zodiac signs

```
(#$thereExistsAtLeast 9 ?PLNT  
  ($isa ?PLNT #$Planet))
```

There are at least 9 planets

# Examples

---

There is at least one planet orbiting the Sun

$\exists x [IsA(x, planet) \wedge Orbits(x, Sun)]$

```
(#$thereExists ?PLANET
  (#$and
    (#$isa ?PLANET #$Planet)
    (#$orbits ?PLANET #$Sun)))
```

---

Everybody loves somebody

$\forall x [IsA(x, person) \rightarrow \exists y [IsA(y, person) \wedge Loves(x, y)]]$

```
(#$forAll ?PERSON1
  (#$implies
    (#$isa ?PERSON1 #$Person)
    (#$thereExists ?PERSON2
      (#$and
        (#$isa ?PERSON2 #$Person)
        (#$loves ?PERSON1 ?PERSON2))))
```

---

The fruit of the apple tree is red

$IsA(x, Fruit(appleTree)) \rightarrow ColorOfObject(x, redColor)$

```
(#$implies
  (#$isa ?X (#$FruitFn #$AppleTree))
  (#$colorOfObject ?X #$RedColor))
```

# There are terms for domain specific relations

---

## Biological relatives

(`#$biologicalRelatives` `#$JerryLeeLewis` `#$JimmySwaggart`)

## Geographical subregions

(`#$geographicalSubregions` `#$UnitedStates` `#$Utah-State`)

## Orbits

(`#$orbits` `#$MoonOfEarth` `#$PlanetEarth`)

# Specific predicates can be used to define syntax and semantics of other predicates

---

arity

```
(#$arity #$biologicalMother 2)
```

arg1Isa, arg2Isa, ....

```
(#$arg1Isa #$biologicalMother #$Animal)
```

```
(#$arg2Isa #$biologicalMother #$FemaleAnimal)
```

# The inference engine is a goal-directed theorem prover

---

Optimized for a large knowledge base:

- Shallow (incomplete)
  - The inference engine stops after a prefixed limit:
    - After T seconds, N depth steps, M chain rules, or N answers
    - Uses a small percentage of the knowledge base and not many steps
- Heuristics
  - Cyc has a set of heuristics (thousands) to rank potential inferences in a preference order.
- Contexts
  - Cyc's inference manages consistency with local inferences in microtheories.

# Cyc has been used in multiple applications

---

## Medical Records Analysis

Semantic interface to medical records databases

## Intelligence / Counter-terrorism Analysis

Knowledge base about terrorism with a natural-language question-answering system

## Financial Analysis

Questions that will impact their investment and trading decisions

## TextPrism

Delivers information based on an individual's specific interests (with interest rules)

## CycSecure

Security risk management and network intrusion prevention tool

# OpenCyc is an open version of the Cyc knowledge base

---

- OpenCyc is part of Cyc
  - Only the core Cyc ontology
- Release 4.0 includes:
  - 2,100,000 triples and 240,000 terms
  - A java-based Cyc Inference Engine
  - The Cyc Knowledge Base Browser
- There is a more complete version for research purposes
  - ResearchCyc

# CYC: LOGICAL REASONING WITH THE WORLD'S LARGEST KNOWLEDGE BASE

## HOME OF SMARTER SOLUTIONS

The Cyc software combines an unparalleled common sense knowledge base with powerful inference engines and natural language interfaces to deliver human-like understanding and transparent explanations of its output and reasoning. Cyc applications can stand alone or work in concert with pattern matching AI tools, such as Machine Learning, to deliver truly differentiated value.

## Welcome to the Cyc Developer Center!

*Your one-stop resource for building smarter software.*

### Cyc APIs

Cycorp provides a suite of Java APIs for updating and querying the Cyc Knowledge Base. This site provides Javadocs, tutorials, and more.

Cycorp is pleased to announce its new Java APIs, the Core API Suite:

- **KB API** - Streamlines the lookup and creation of terms and assertions in the Cyc knowledge base.
- **Query API** - Tools for asking arbitrarily complex questions of a Cyc server, and dealing with the answers.
- **Session API** - Defines the basic functionality for connecting to a Cyc server, and is used for this purpose by all the other Cyc APIs.

[Click here to learn more!](#)

### Ontology Development

New to Cyc? We recommend these [tutorials to get started on ontology development](#).

The [Ontologist's Handbook](#) explores the principles of ontology development and knowledge editing. Handbook sections include Writing Efficient CyCL, KE and OE Tools, and CyCL Queries.

Or, view [more ontology development resources](#).

## What's new...

**January 2018: New [Cyc Core API Suite v1.1.1](#)**

# What are the strengths and weaknesses of Cyc?

---

- Strengths
  - The first attempt to build a common sense KB (1984)
  - Large content (millions of assertions about universals)
  - Expressive language and powerful inference (CycL, theorem prover)
  - Practical applications (terrorism, medicine, etc.)
- Weaknesses
  - Cyc is a commercial approach partially closed
  - It is incomplete
  - Unsatisfactory treatment of some concepts

# Sumo is a public knowledge base

---

- The name Sumo is from Suggested Upper Merged Ontology
- Developed initially in the company Teknowledge and then the company Articulate Software
- Adam Pease is the technical editor of Sumo

Adam Pease

[Pease et al., 2002]

# The size of Sumo is small compared to the Cyc knowledge base

---

81,000 axioms

22,000 terms

5,000 rules

1,400 relations

# Sumo uses the logic-based language SUO-KIF

---

```
(forall (?X ?Y)
  (=>
    (and
      (instance ?X Farmer)
      (instance ?Y Tractor))
    (likes ?X ?Y)))
```

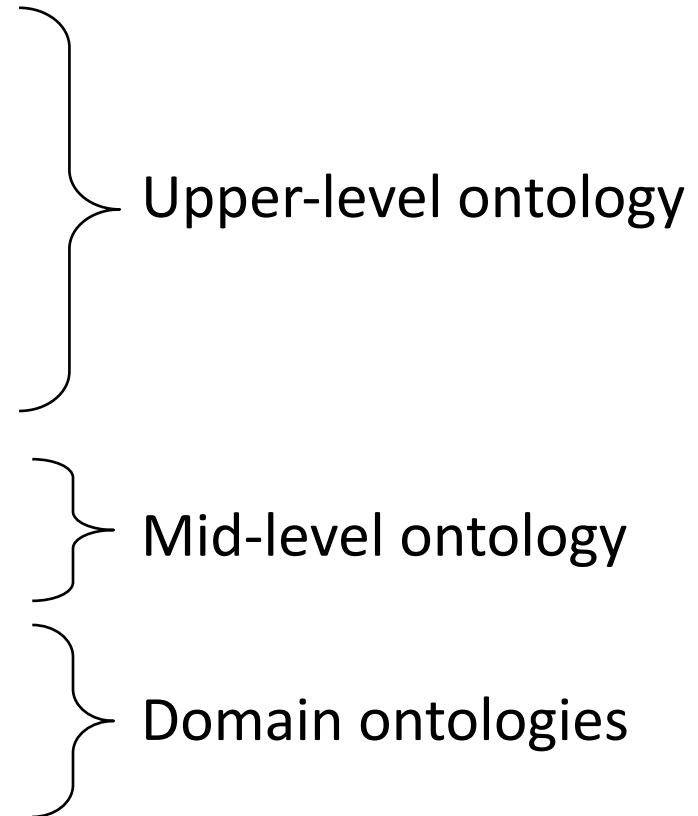

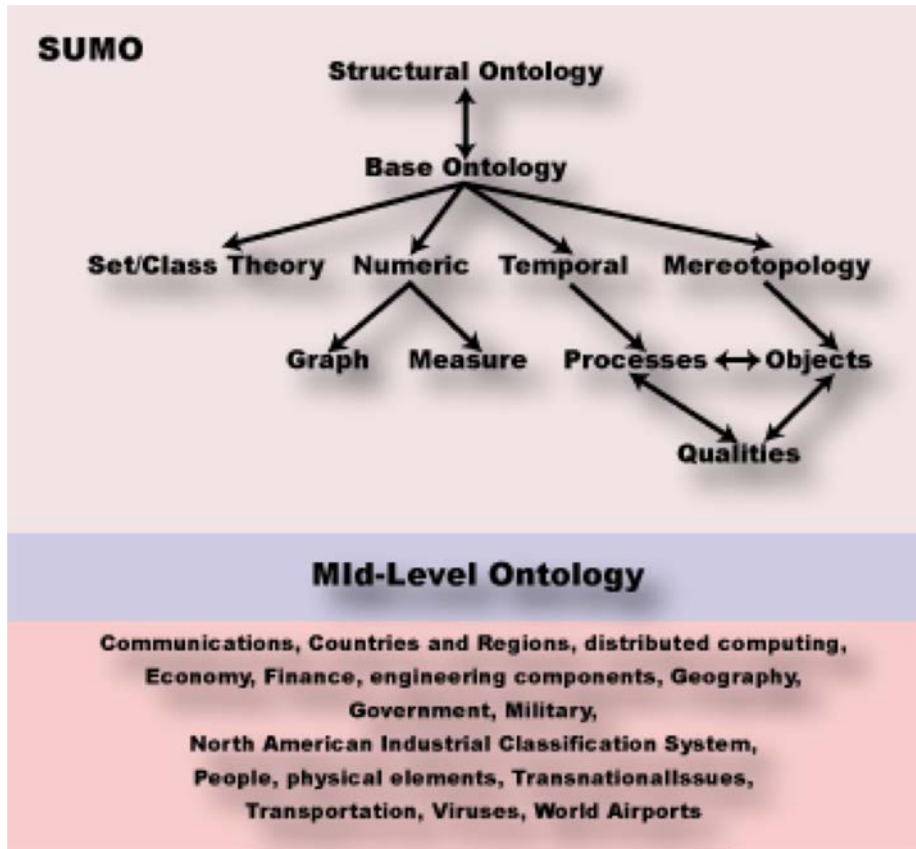

$\forall x, y [Instance(x, farmer) \wedge Instance(y, tractor) \rightarrow Likes(x, y)]$

---

```
(=>
  (instance ?X Atom)
  (exists (?Y ?Z)
    (and
      (component ?Y ?X)
      (component ?Z ?X)
      (instance ?Y Proton)
      (instance ?Z Electron))))
```

$Instance(x, atom) \rightarrow \exists y \exists z [Comp(y, x) \wedge Comp(z, x) \wedge Instance(y, proton) \wedge Instance(z, electron)]$

# The knowledge base is structured in three main layers

# Extract from the upper-level ontology: relation “overlapsSpatially”

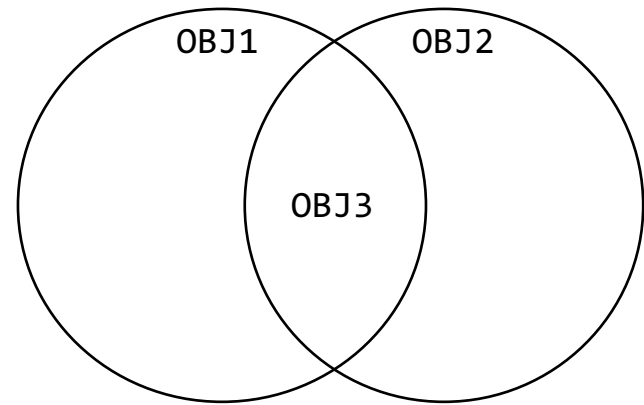

---

```
(subrelation overlapsSpatially connected)
(instance overlapsSpatially ReflexiveRelation)
(instance overlapsSpatially SymmetricRelation)
```

```
(<=>
  (overlapsSpatially ?OBJ1 ?OBJ2)
    (exists (?OBJ3)
      (and
        (part ?OBJ3 ?OBJ1)
        (part ?OBJ3 ?OBJ2))))
```

```
(=>
  (and
    (member ?OBJ1 ?COLL)
    (member ?OBJ2 ?COLL)
    (not (equal ?OBJ1 ?OBJ2)))
  (not
    (overlapsSpatially ?OBJ1 ?OBJ2)))
```

```
(=>
  (and
    (instance ?REL CaseRole)
    (instance ?OBJ Object)
    (?REL ?PROCESS ?OBJ))
  (exists (?TIME)
    (overlapsSpatially (WhereFn ?PROCESS ?TIME) ?OBJ)))
```

# Extract from the mid-level ontology: subclass “Divorcing”

---

```
(subclass Divorcing Declaring)
```

```
(=>
```

```
  (instance ?D Divorcing)
```

```
  (exists (?P1 ?P2 ?T1 ?T2)
```

```
    (and
```

```
      (holdsDuring ?T1
```

```
        (spouse ?P1 ?P2))
```

```
      (holdsDuring ?T2
```

```
        (not (spouse ?P1 ?P2)))
```

```
      (finishes ?T1 ?D)
```

```
      (starts ?T2 ?D))))
```

# Sumo includes a variety of domain ontologies

---

- communications,
- countries and regions,
- economy, finance,
- automobiles and engineering components,
- food,
- sports,
- shopping catalogs and Hotels,
- geography,
- government and Justice,
- language taxonomy,
- media and music,
- military (general, devices, processes, people),
- people and their emotions,
- physical elements,
- ...

## Suggested Upper Merged Ontology (SUMO)

[\[Home\]](#) | [\[Browse\]](#) | [\[Download\]](#) | [\[Publications\]](#) | [\[Tools\]](#) | [\[What's New\]](#) | [\[About\]](#)

The Suggested Upper Merged Ontology (SUMO) and its domain ontologies form the largest formal public ontology in existence today. They are being used for research and applications in search, linguistics and reasoning. SUMO is the only formal ontology that has been mapped to all of the [WordNet](#) lexicon. SUMO is written in the [SUO-KIF](#) language. SUMO is free and owned by the IEEE. The ontologies that extend SUMO are available under [GNU General Public License](#). [Adam Pease](#) is the Technical Editor of SUMO.

### Features

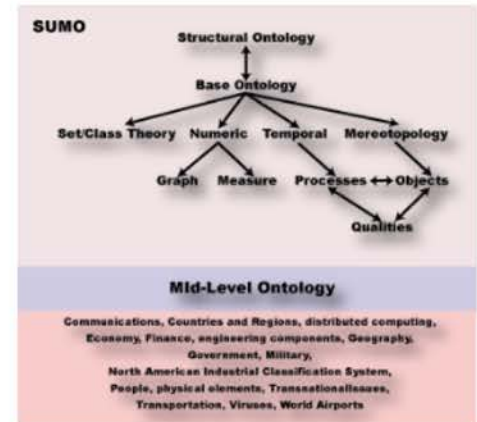

- [Mappings](#) to all of WordNet
- [Language generation templates](#) for Hindi, Chinese, Italian, German, Czech and English
- Tools for browsing, editing, inferencing and NLP with SUMO are found in the SigmaKEE ([source](#), [api](#), [docker image](#)) and SigmaNLP ([source](#), [api](#), [docker image](#)) systems
- Largest free, formal ontology available, with ~25,000 terms and ~80,000 axioms when all domain ontologies are combined. These consist of SUMO itself, the [Mid-Level Ontology \(MILO\)](#), and ontologies of [Communications](#), [Countries and regions](#), [Distributed computing](#) and [User interfaces](#), [Economy](#), [Finance](#), [Automobiles](#) and [Engineering components](#), [Food](#), [Dining](#), [Sports](#), [Shopping catalogs](#) and [Hotels](#), [Geography](#), [Government](#) and [Justice](#), [Language taxonomy](#), [Law](#), [Media](#) and [Music](#), Military ([General](#), [Devices](#), [Processes](#), [People](#)), [North American Industrial Classification System](#), [People](#) and their [Emotions](#), [Physical elements](#), [Transnational issues](#), [Transportation](#) and its [Details](#), [Viruses](#), [Weather](#), [world airports](#), and [weapons of mass destruction](#). See also a large amount of instance content from DBpedia about [people](#) and the [YAGO](#) project which includes millions of facts from Wikipedia merged with SUMO, and an initial merge of the Mondial [geographical data](#) with SUMO. The Open Biomedical Ontologies are lightly [mapped](#) to SUMO. Additional ontologies of terrorism are available on request.
- Richly axiomatized, not just a taxonomy. All terms are formally defined. Meanings are not dependent on a particular inference implementation.

### Documentation and other resources

- An introductory [talk](#), [podcasts](#) and a [blog](#) about SUMO and Sigma
- Some good [examples](#) that show why simple search isn't enough and that we need inference to synthesize information from multiple sources
- look at [historical versions](#) of SUMO
- We ask that people working with SUMO cite our [primary paper](#) and [book](#) in any publications
- [Conformance](#) testing for SUMO
- Translation of [SUMO into OWL](#) and [WordNet 3.0 in OWL](#)
- WordNet in [TPTP format](#)
- Some thoughts on an ontology development [process](#) and ontology development [pitfalls](#)
- An introduction to [resolution theorem proving](#)
- [Frequently asked questions](#)
- A [word sense frequency analysis](#) based on WordNet SemCor that can be used for simple word sense disambiguation. This was done on WN 1.6 but could be rerun with the [automatic remappings to 2.0](#)
- A [very big graph](#) of the taxonomy in SUMO v 1.75 (too big to display in a browser, download and view in a drawing application)

Find an English word and its corresponding formal term in SUMO:

English

# Sigma: An integrated development environment [Pease, Benzmüller, 2002]

The screenshot shows a web browser window titled "Sigma Knowledge Engineering Environment - Ask/Tell - Mozilla Firefox". The address bar shows "http://localhost:8080/sigma/AskTell.jsp". The page header includes the Sigma logo and the text "Sigma knowledge engineering environment Inference Interface". There are navigation links for [ Home | Graph | Prefs ] and a KB dropdown menu set to "SUMO". A Language dropdown menu is also present.

The main content area contains a text input field with the query "(instance ?X Relation)". Below the input field are two text boxes: "Maximum answers: 1" and "Query time limit: 30". A section titled "Choose an inference engine:" contains a list of radio buttons for different engines: Vampire (selected), SInE (+Vampire) (experimental), STP (experimental), STP2 (experimental), LEO-II with SInE (experimental), LEO-II local (experimental), LEO-II global (experimental), and System on TPTP. Below the list are "Ask" and "Tell" buttons.

The results section is titled "Answer 1. [definite] ?X = partition" and displays a list of 7 results. Each result is a logical expression with a corresponding KB label in the right column.

Result	KB
1. (instance partition VariableArityRelation)	[KB]
2. (not (instance ?VAR1 Relation))	[KB]
3. (subclass VariableArityRelation Relation)	[KB]
4. (forall (?VAR1 ?VAR2) (=> (subclass ?VAR1 ?VAR2) (and (instance ?VAR1 SetOrClass) (instance ?VAR2 SetOrClass))))	[KB]
5. (or (instance ?VAR1 SetOrClass) (not (subclass ?VAR1 ?VAR2)))	4
6. (or (instance ?VAR1 SetOrClass) (not (subclass ?VAR2 ?VAR1)))	4
7. (forall (?VAR1 ?VAR2 ?VAR3) (=> (and (instance ?VAR2 SetOrClass)	[KB]

# What are the strengths and weaknesses of Sumo?

---

- Strengths
  - Open source initiative
  - Expressive representation and inference (SUO-KIF, Vampire)
  - Software resources (e.g., Sigma)
- Weaknesses
  - Small size compared to Cyc: 81K axioms (Cyc 7M assertions)
  - Incomplete content

# There are other initiatives related to Cyc and Sumo

---

- ThoughtTreasure
  - A common sense knowledge base initiated by E. Mueller. Size: 27,000 concepts and 51,000 assertions (from 1993 to 2000) [Mueller, 1998]
- Upper ontologies
  - There are multiple proposals developed as upper ontologies (BFO, DOLCE, GFO, COSMO, etc.)

# What are the strengths and weaknesses of manual acquisition of common sense knowledge?

---

- Strengths
  - The content of the knowledge base can grow in a more controlled way
  - Implicit common sense knowledge, which is not written in texts, can be identified and formulated by knowledge engineers
  - Expressive logic-based languages can be used with powerful inference methods
- Weaknesses
  - The effort required for manual acquisition of common sense knowledge is considerable
  - The current common sense knowledge bases that are built manually are incomplete
