President: Don't keep arguing, I have an idea. Let's ask Architect students.

One week later

President: I have it!
I have just received a solution of our situation!

Politician 1: And will it be expensive?

President: No. It's for FREE!

Politician 2: I don't believe you!

President: Let me explain you.
The idea is that we will not construct. Since now we will change the rules!

We will no more build houses around the city, but on the city of today.

We will make the vertical city.

Old fashioned sociologist: But the distance between people will be too big like this!

President: No, it won't. We will bring the public places up. The only thing we have to do is a new law: everyone who wants to add new floors to his house, must give us one floor for a public places.

Like this we will create a new city with its own topography- do you want a hill in your town? We will just create a public place few stories higher. The fire basins will serve as a new lakes.

Politician 2: But what will happen with the city of today?

President: As new layer will be translucent, there will be enough sun also for the city „downstairs“. There will be services like shopping centers, cinemas, offices and transportation. The old city will be to use, the new one with its pedestrian ways and parks to live.

Old fashioned sociologist: Ooooh! A new world, with parks and no cars in sky! That sounds like PARADISE!
