

En un tramo de carretera L Q, con coordenadas de los extremos del eje:

$$X_L = 617,031 \text{ m}$$

$$X_Q = 917,314 \text{ m}$$

$$Y_L = 1530,719 \text{ m}$$

$$Y_Q = 2040,403 \text{ m}$$

Calcular las coordenadas de los puntos alineados cada 50 metros a partir de L.

$$\begin{aligned}\theta_L^Q &= \arctg \frac{X_L - X_Q}{Y_L - Y_Q} = 33,8940^\circ \\ D_{LQ} &= \sqrt{(X_L - X_Q)^2 + (Y_L - Y_Q)^2} = 591,56 \text{ m} \\ \frac{591,56}{50} &= 11,8 \text{ puntos}\end{aligned}$$

$$P_1: \left\{ \begin{array}{l} X_1 = X_L + 50 \text{ m} \operatorname{sen} \theta_L^Q = 642,411 \text{ m} \\ Y_1 = Y_L + 50 \text{ m} \cos \theta_L^Q = 1573,798 \text{ m} \end{array} \right.$$

$$P_2: \left\{ \begin{array}{l} X_2 = X_1 + 50 \text{ m} \operatorname{sen} \theta_L^Q = 667,791 \text{ m} \\ Y_2 = Y_1 + 50 \text{ m} \cos \theta_L^Q = 1616,877 \text{ m} \end{array} \right.$$

$$P_3: \left\{ \begin{array}{l} X_3 = X_2 + 50 \text{ m} \operatorname{sen} \theta_L^Q = 693,172 \text{ m} \\ Y_3 = Y_2 + 50 \text{ m} \cos \theta_L^Q = 1659,956 \text{ m} \end{array} \right.$$
